1. Homepage

Is Africa as a total on track to meet the nutrition goals?

Twenty indicators are shown in four categories: Nutrition Status, Service Coverage, Enabling Environment and Socio-economic Impact. The **color** of each indicator box represents the level of progress on the continent

The blue button in each category links to the Scorecard to show the **progress per country**.

If you select an indicator box, a **popup** will show a chart in case Africa wide data are available. You can hover data points.

The button at the bottom right links to the **Indicator page**. Without Africa wide data, this popup will not show. You will be directed to the Indicator page directly.

2. Scorecard

Are individual countries on track to meet the nutrition goals?

Select a **category of indicators** to view in the scorecard table.

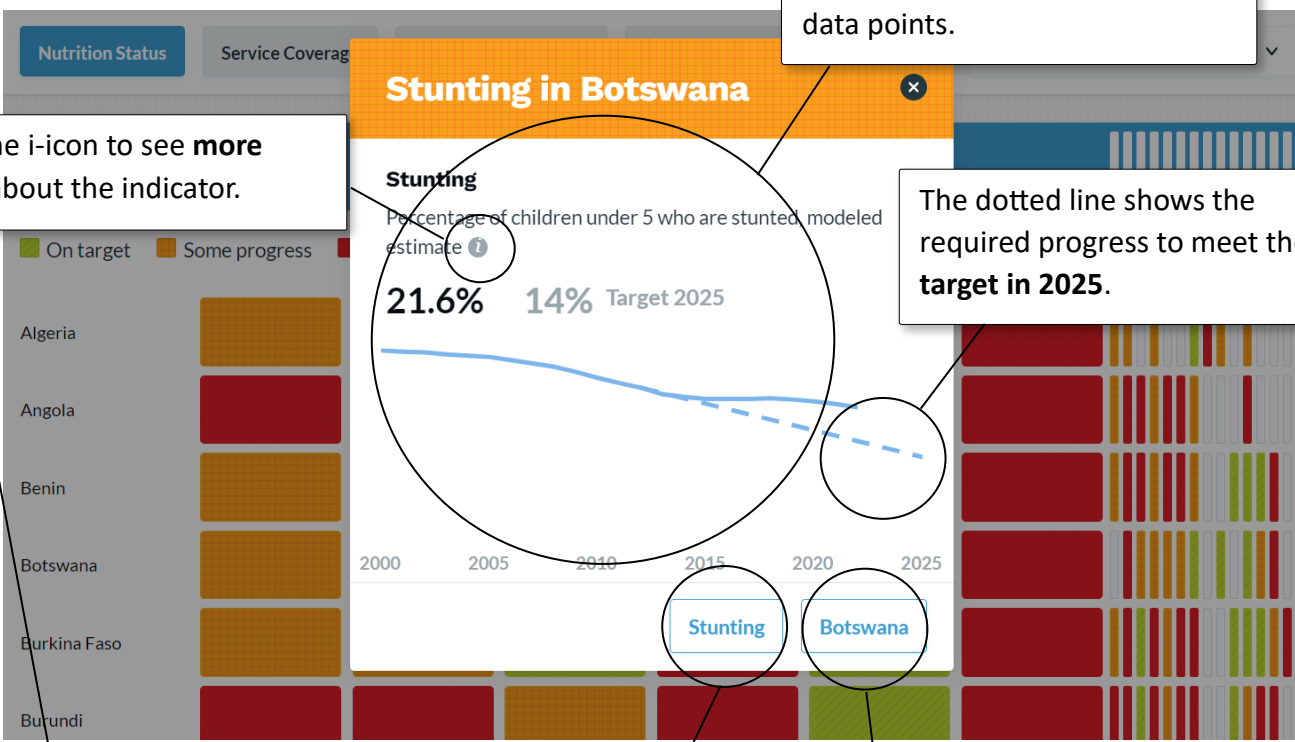

Select the country column header to sort **alphabetically**.

Select the indicator column header to sort by **level of progress**.

Toggle between regular size (all countries equal row height) and rows resized **relative to population size**.

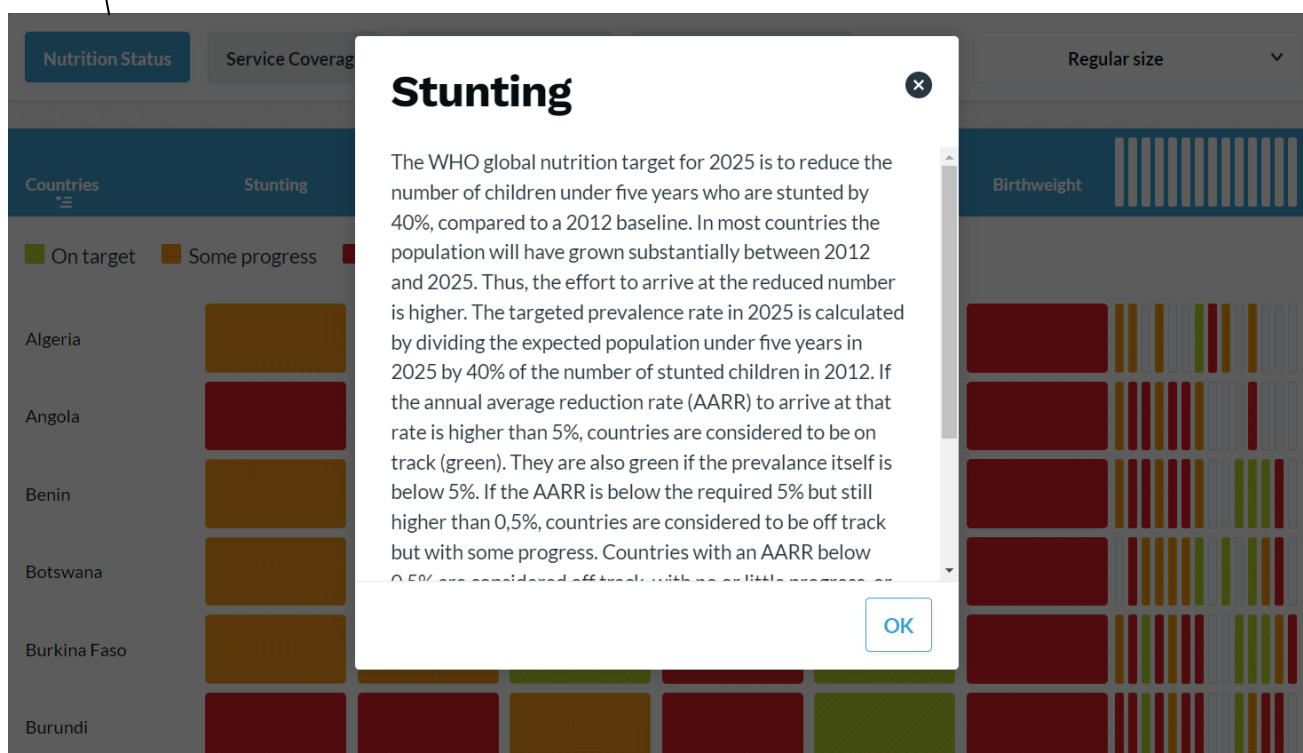

Select a block to view a popup with a chart with **country progress**. Hover the chart to see data points.

Select the i-icon to see **more details** about the indicator.

The dotted line shows the required progress to meet the **target in 2025**.

Select the indicator button to go to the **Indicator page**.

Select the country button to go to the **Country page**.

IV. Summary gives a **short overview** of the progress.

IV. Summary

Rwanda is doing quite well in regard to the global nutrition goals. Exclusive breastfeeding has by far the highest prevalence in Africa, above 80% during the last three decades. The country has witnessed a reduction in stunting, birthweight and anaemia for women, but the pace is flattening. A steep increase has been booked for antenatal care, from 10% around the year 2000 to 47% in 2020. It's still below the threshold of 50%, used on this scorecard as a minimum, hence the red status for progress. Like in the neighbouring countries, the prevalence of anaemia is very low.

Nutrition Status

Stunting

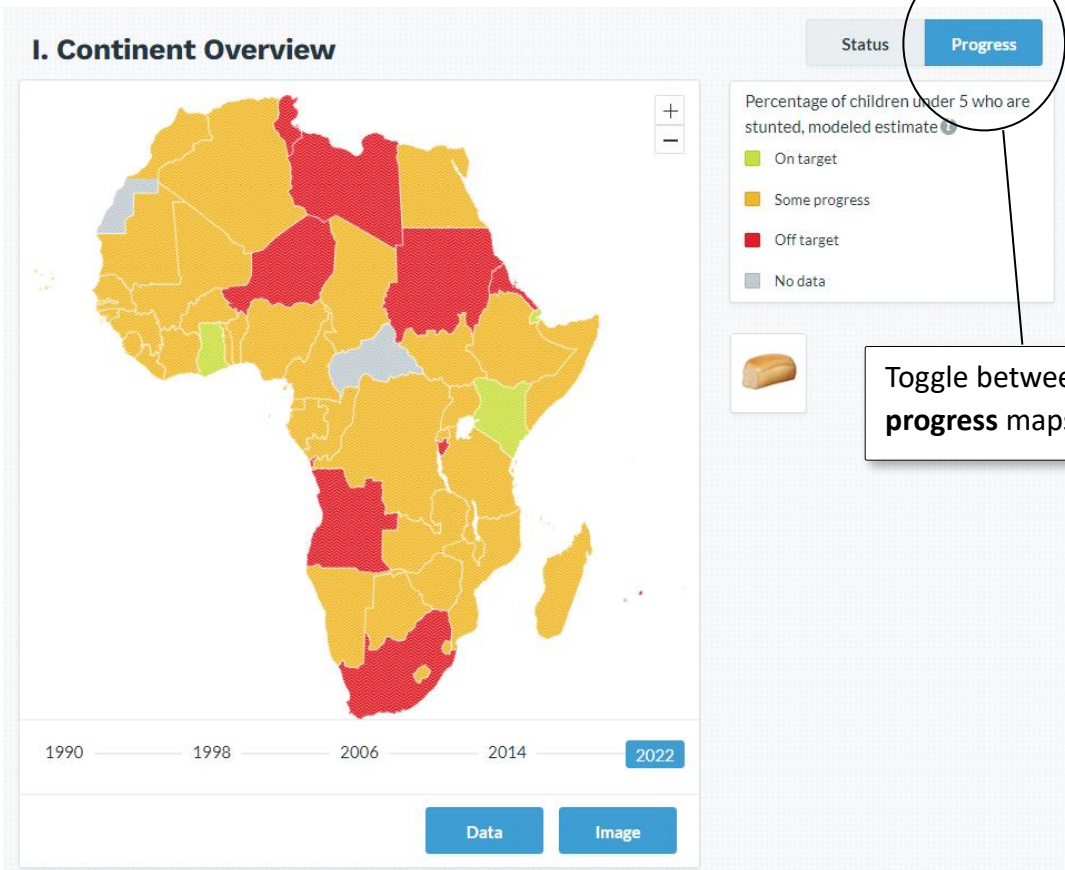

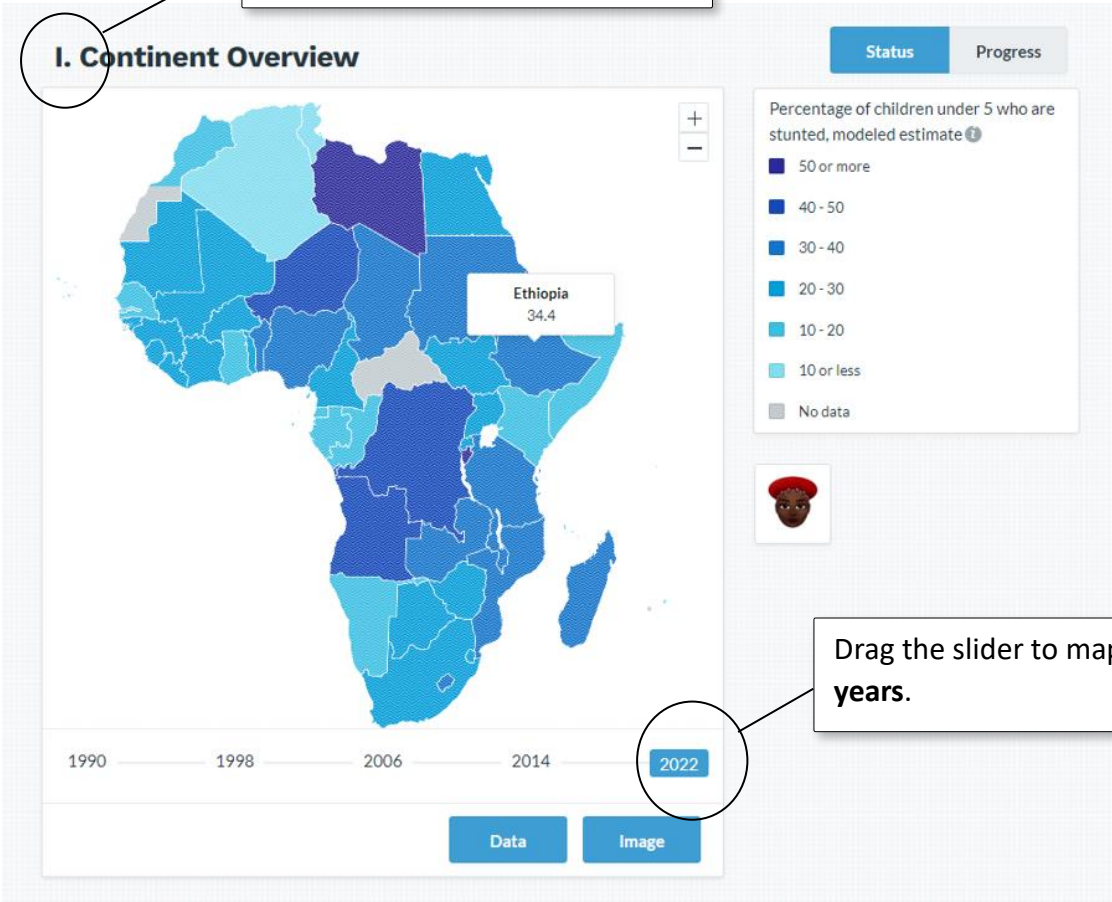

Childhood stunting, an overarching measure of long-term malnutrition, has life-long consequences not just for health, but also for human capital and economic development, prosperity, and equity. Being stunted in early childhood reduces schooling attainment, decreases adult wages, and makes children less likely to escape poverty as adults. The global nutrition target for is to reduce the number of children under
